The aerodynamic coefficients and derivatives presented were extracted from the position-attitude-time histories of the experimentally measured trajectories using nonlinear numerical integration data reduction routines. Results of this testing and analysis show the static and dynamic stability variations for four different fin offset configurations. Aug 14, Request PDF on ResearchGate Aerodynamics of Missiles with Offset Fin Configurations : Subsonic and transonic aerodynamic data for offset fin configurations are presented. variations for four different fin offset configurations. The presence of a side moment dependent on pitch angle results in dynamic instability under certain conditions. The stability boundaries associated with this side moment are mapped. Designers should consider this moment whenever offset fins are utilized. "+" mounted missiles would need more complex hard points and larger weapon bays. Once fired the configuration doesn't matter anymore as all four control surfaces are continuously used to guide and stabilize the missile along its 3d trajectory. If the missile only moves in the horizontal or vertical plane, the X configuration is better.
